3 XML: Vocabulary and Techniques

Definition

A (document) markup language is a modern system for annotating a document in a way that is syntactically distinguishable from the text.

Examples ?

Definition

A (document) markup language is a modern system for annotating a document in a way that is syntactically distinguishable from the text.

Examples ?

- $\text{PT}_{EX} \setminus \text{textbf} \{\bullet\} \setminus \text{section} \{\bullet\}$
- HTML <i></i>
- XML
- ...

Why? Historical reasons

Internet is huge, diverse, heterogeneous, thus how can we perform:

- data transmission ?
- standardization ?
- easy manipulation ?

Internet is huge, diverse, heterogeneous, thus how can we perform:

- data transmission ?
- standardization ?

• easy manipulation ?

Internet is huge, diverse, heterogeneous, thus how can we perform:

- data transmission ?
- standardization ?
- easy manipulation ?

2 XML Specificities and Motivations

3 XML: Vocabulary and Techniques

XML Specificities

XML:

- XML is made for storing data
- Is not made for displaying information
- Lets you invent your own tags

XML Specificities

XML:

- XML is made for storing data
- Is not made for displaying information
- Lets you invent your own tags

```
<?xml version="1.0" encoding="UTF-8"?>
<俄语>данные</俄语>
```

Why is XML useful?

As	sets -	lemms -	LibreOffice	Base: Table Data View

1.0					-	

Why is XML useful?

XML is useful because:

• it allows you to share highly compatible data, between systems, over time...

• It is often used in NLP

Why is it useful?

Because XML is flexible, it allows to make some by-products.

Because XML is flexible it allows to make some by-products.

۰

Because XML is flexible it allows to make some by-products.

MusicXML

<?xml version="1.0" encoding="UTF-8" standalone="no"?> <!DOCTYPE score-partwise PUBLIC "-//Recordare//DTD MusicXML 3.0 Partwise//EN" "http://www.musicxml.org/dtds/partwise.dtd"> <score-partwise version="3.0"> <part-list> <score-part id="P1"> <part-name>Music</part-name> </score-part> </part-list> <measure number="1"> <attributes> <divisions>1</divisions> <kev> <fifths>0</fifths> </key> <time> <beats>4</beats> <beat-type>4</beat-type> </time> <clef> <sign>G</sign> <line>2</line> </clef> </attributes> <note> <pitch> <step>C</step>

Representation of middle C on the treble clef created through MusicXML code.

Because XML is flexible it allows to make some by-products.

2 XML Specificities and Motivations

XML document must respect some syntax rules:

- a good nested order
 - <book><title></title><author></author></book>
 - $*\!\!<\!\!book\!\!>\!\!<\!\!title\!\!>\!\!<\!\!author\!\!>\!\!<\!\!/title\!\!>\!\!<\!\!author\!\!>\!\!<\!\!/book\!\!>$

note: you can just as well create empty tags: <author/>

- XML is case sensitive
- root element is mandatory
- write comments like that: <! -- My comment -->
- attributes are between " ", <myTag myAttribute="0">

Vocabulary definition

XML document must respect some syntax rules:

- a good nested order
- XML is case sensitive <Title></Title><author></author> *<Title></title><author></author>
- root element is mandatory
- write comments like that: <! -- My comment -->
- attributes are between " ", <myTag myAttribute="0">

QUIZ

```
<?xml version="1.0"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Don't forget me this weekend!</body>
</note>
```

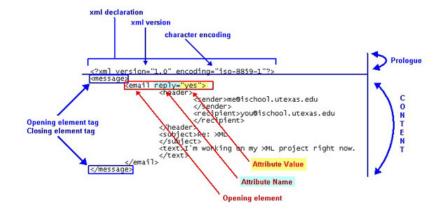

Is this (above) a "well formed" XML document? • Yes • No

QUIZ

<?xml version="1.0"?> <to>Tove</to> <from>Jani</from> <heading>Reminder</heading> <body>Don't forget me this weekend!</body>

Is this a "well formed" XML document? Yes No

XML Structure

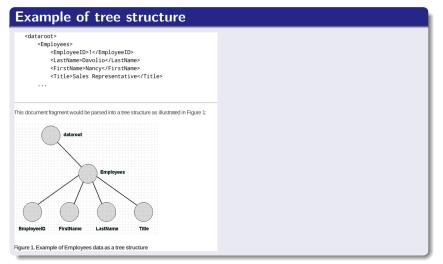

XML Structure

XML has what we call a tree structure.

XML Structure

XML has what we call a tree structure.

Let's practice

Are you able to give me the tree structure of this XML?

<Text_description> <words>5</words> <text>Det var så lite.</text> <contents><w><lemma>det</lemma><form>Det</form></w> <w><lemma>så</lemma><form>så</form></w> <w><lemma>lite</lemma><form>lite</form></w> <w><lemma>.</lemma>.</form>lite</form></w> </contents> </Text_description> The structure definition of an XML document is described by a "Document Type Definition", or "dtd"

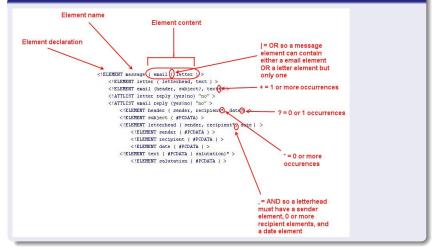

An XML is sometimes associated to a DTD thanks to an extra line added at the beginning of the XML.

<?xml version="1.0" encoding="utf-8" standalone="no"?>
<!DOCTYPE Text_description SYSTEM "text.dtd">
<Text_description>
<words>5</words>
<text>Det var så lite.</text>

(DTD declaration is on the second line)

Anatomy of a DTD

DTD

Example:

XML

<Text_description> <words>5</words> <text>Det var så lite.</text> <contents><w><lemma>det</lemma><form>Det</form></w> <w><lemma>wara</lemma><form>så</form></w> <w><lemma>lite</lemma><form>lite</form></w> <w><lemma>.</lemma>cform>lite</form></w> </contents> </Text_description>

DTD

```
<!ELEMENT Text_description (words,text,contents)>
<!ELEMENT words (#PCDATA)>
<!ELEMENT text (#PCDATA)>
<!ELEMENT contents (w+)>
<!ELEMENT w (lemma,form)>
<!ELEMENT form (#PCDATA)>
<!ELEMENT lemma (#PCDATA)>
```

Vocabulary

When an XML document respects the DTD we say that it is "valid" $% \left(\mathcal{M}_{n}^{2}\right) =\left(\mathcal{M}_{n}^{2}\right) \left(\mathcal{M}_{n}^{2}$

Tools

Commands exist to check that your XML is well formed/valid

• Well formed:

xmllint -noout document.xml

• Valid:

xmllint -noout -valid document.xml

XPath

Definition

XPath, the XML Path Language, is a query language for selecting nodes from an XML document. XPath uses path expressions to select nodes or node-sets in an XML document. These path expressions look very much like the expressions you see when you work with a traditional computer file system.

XPath tool: xmlstarlet

Among other functions, you can select elements in your XML with xmlstarlet like this:

xmlstarlet sel -t -v "XpathCommand" document.xml

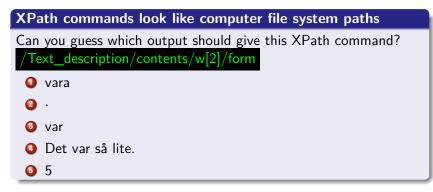

Example:

xmlstarlet sel -t -v "/Text_description/contents/w[2]/form" lemms.xml

XPath

<Text_description> <words>5</words> <text>Det var så lite.</text> <contents><w><lemma>det</lemma><form>Det</form></w> <w><lemma>vara</lemma>cform>så</form></w> <w><lemma>lite</lemma>cform>lite</form></w> <w><lemma>lite</form>lite</form>/w> </contents>

</Text_description>

What XPath is used for?

XPath is useful for:

- Navigating in the XML
- Creating XSLT

Definition

XSL stands for EXtensible Stylesheet Language, and is a style sheet language for XML documents. XSLT stands for XSL Transformations.

XSL is to XML what CSS is to HTML

		Mozilla Firefox		- + ×
+ []	cdcatalog.xml		v 🔊 🚱 v Yahoo	् 🔺 🔯 🗸
Firefox	🔻 🐢 🗍 file:///media/Ves/cdcatalog.xml	+		

My CD Collection

Title	Artist	
Empire Burlesque		
Please Please Me	Beatles	

🝻 cdcatalog.xml 🗱	cdcatalog.xsl 🗱	
xml version="1.0" encoding="UTF-8"?	<pre><?xml version="1.0" encoding="UTF-8"?></pre>	
<pre><?xml-stylesheet type="text/xsl" href="cdcatalog.xsl"?</pre></pre>	×	
<catalog></catalog>	<pre><xsl:stylesheet <="" pre="" version="1.0"></xsl:stylesheet></pre>	
<cd></cd>	<pre>xmlns:xsl="http://www.w3.org/1999/XSL/Transform"></pre>	
<title>Empire Burlesque</title>		
<artist>Bob Dylan</artist>	<pre><xsl:template match="/"></xsl:template></pre>	
<country>USA</country>	<html></html>	
<company>Columbia</company>	<body></body>	
<price>10.90</price>	<h2>My CD Collection</h2>	
<year>1985</year>		
<cd></cd>	Title	
<title>Please Please Me</title>	Artist	
<artist>Beatles</artist>		
<country>UK</country>	<pre><xsl:for-each select="catalog/cd"></xsl:for-each></pre>	
<company>Polydor</company>		
<price>15.5</price>	< <td></td>	
<year>1963</year>		

XSL advantages and drawbacks

The XSL language manages:

- loops <xsl:for-each>
- conditions < xsl:if >
- sorting <xsl:sort>
- this language is very wordy
- no regex (must use XSL 2.0)

What should you do when you get an XML and an XSLT?

If you want to display it in a browser: add this red line to the XML and open the XML:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-stylesheet type="text/xsl" href="cdcatalog.xsl"?>
<catalog>
<cd>
<title>Empire Burlesque</title>
<atist>Bob Dylan</artist>
<country>USA</country>
```

If you want to get the output directly, use a processor.

xsltproc document.xml document.xsl > whatever

What experience will tell you

Even if XML can (almost)always be handled by writing your own program and regex... Handling XML tools will save you time. Look in your favourite language documentation: Python, Java etc. there is always a library for it. As any language XML, XPath, XSLT are learned through practice!

What experience will tell you

Summary

- Today we learnt about a mark up language called XML. It allows to structure data/text.
- Since XML is hyper-flexible we sometimes need a Document Type Definition (DTD) associated with it
- We learned some part of the XML terms, mainly 'well formed' and 'valid'
- The XSL based on Xpath language is one solution for transforming your XML into whatever other document: plain text, html etc.

QUIZ

When an XML document is conform to the dtd we say that it is:

- Well formed
- Conformist
- Valid
